The Similarity and Frequency of Proposals to Reform US Medical Education

Constant Concerns

Nicholas A. Christakis, MD, PhD, MPH

Objectives.—To identify the values and agendas underlying reports advocating the reform of medical education and to account for their similarity and repeated promulgation.

Data Sources.—Major reports regarding undergraduate medical education reform published between 1910 and 1993 were identified through a manual bibliographic search.

Study Selection.—Nineteen of a total of 24 reports met the two inclusion criteria: they directly addressed undergraduate medical education and contained a coherent body of recommendations.

Data Extraction.—Content analysis of 19 reports.

Data Synthesis.—All the reports articulate a specifically social vision of the medical profession, in which medical schools are seen as serving society. The reports are remarkably consistent regarding the objectives of reform and the specific reforms proposed. Core objectives of reform include the following: (1) to better serve the public interest, (2) to address physician workforce needs, (3) to cope with burgeoning medical knowledge, and (4) to increase the emphasis on generalism. Proposed reforms have tended to suggest changes in manner of teaching, content of teaching, faculty development, and organizational factors. Reforms such as increasing generalist training, increasing ambulatory care exposure, providing social science courses, teaching lifelong and self-learning skills, rewarding teaching, clarifying the school mission, and centralizing curriculum control have appeared almost continuously since 1910.

Conclusion.—The similarity of the reports' objectives and reforms results not only from a similar body of problems, but also from the reaffirmation of similar values. The reports have two implicit agendas that transcend the reform of medical education: the affirmation of the social nature of the medical profession and self-regulation of the profession. These agendas help account for the reports' similarity and their repeated promulgation.

(JAMA. 1995;274:706-711)

IN 1910, Abraham Flexner released his famous report recommending the radical reform of medical education in the United States. While this report was successful in its main intentions, in retrospect it can be seen as only the initial salvo in what has been nearly a century of successive reform proposals. Indeed, in the intervening years, there have been at least 24 major reports advocating reform, and such reports are currently emerging virtually annually. Typically, these reports identify strikingly similar problems with medical education, claim that previous reports have gone relatively unheeded, argue that reform is essential and urgent, and prescribe corrections that are also strikingly similar. The existence of so many similar reports in such a relatively short period raises a perplexing question regarding medical education: either medical schools have remained intrinsically devoted to deficient modes of education—which seems unlikely, especially given the real changes that have occurred in medical education—or there is another rationale for the promulgation of these reports. In this article, I argue there is an ethos of reform in US medical education that has two purposes that transcend improving the educational experience of medical students: the reaffirmation of certain core values of the profession and the self-regulation of the profession. In developing this argument, I review the reports' objectives and recommendations, elucidate their underlying rhetorical structure, and describe their implicit and explicit functions in sustaining the medical profession. Since this analysis is limited to the reports and does not include actual educational practice, it is impossible to assess the extent to which medical education has evolved as a result of, or despite, the reform proposals.

METHODS

This article focuses on 19 of 24 major reports on the status and promise of medical education published between 1910 and 1993 (Table 1). The 19 reports directly address undergraduate medical education and contain a coherent body of recommendations. Reports not meeting these criteria are not included in this analysis. Detailed content analysis was used to identify and elucidate themes in the reports. I provide illustrative rather than comprehensive quotations to illustrate the themes; greater detail is available elsewhere.

RESULTS

The Affirmation of Core Values

The purpose of medicine and medical schools articulated by the reports has remained relatively constant since 1910. In general, the reports suggest that medicine as a discipline and physicians as professionals exist to serve society. Flexner, for example, argues, "The medical profession is a social organ, created not for the purpose of gratifying the inclinations or preferences of certain individuals, but as a means of promoting health, physical vigor, happiness—and the economic independence and efficiency immediately connected with these factors." This dependence of medicine on society is not without consequences; it generates a reciprocal obligation of medical schools and the medical profession to...
accommodate societal needs. Elsewhere, Flexner notes, 

The physician is a social instrument. If there were no disease, there would be no doctors. And as disease has consequences that immediately go beyond the individual specifically affected, society is bound to protect itself against unnecessary spread of loss or danger. Practically the medical school is a public service corporation. It is chartered by the state; it utilizes public hospitals on the ground of the social nature of its service. The medical school cannot then escape social criticism and regulation.\(^n\)\\text{[10]}\\\n
Similar themes are developed in all the reports. For example, the 1966 American Medical Association (AMA) report observes, "Medicine exists to serve society. . . . It must ever be responsive to the needs of the society it serves.\(^n\)\\text{[11]}\\\n
The 1989 New York Academy of Sciences report notes that "faculties and schools of medicine are falling in too many instances to produce socially responsible doctors who unequivocally recognize medicine as a social good, not a commercial commodity."\(^n\)\\text{[12]}\\\n
And the 1991 report by the Pew Health Professions Commission also portrays "the education and training of health professionals" as being subservient to the "health needs of the American people."\(^n\)\\text{[13]}\\\n
Failure to make an effort to understand and respond to community needs," it argues, "violates the basic covenant between health professionals and people they have obligated themselves to serve.\(^n\)\\text{[14]}\\\n
The explicit statement that medical schools serve society both reassures the public that the profession warrants trust and obviates any outside regulation that a subordinate relationship would ordinarily permit. Indeed, several reports argue that the profession must reform itself, lest outsiders take up the task. For example, the 1966 AMA report notes, \n
For any learned profession there are but two alternatives for establishing standards of practice and education. Responsibility can be assumed by society as a whole, operating through government, or can be assumed by the organized profession through a voluntarily accepted self-discipline. There are no other alternatives, for, if the profession does not take responsibility, society will surely demand that the vacuum be filled and the government assume the responsibility.\(^n\)\\text{[15]}\\\n
By the mid 1960s, the relationship between the public on the one hand and the schools and the profession on the other undergoes a subtle but important transformation: from voluntary supply of an essential societal need to involuntary response to an exacting societal demand. For example, the 1966 American Surgical Association (ASA) report observes, "The number of those who make demands upon the medical profession has steadily increased. But superimposed upon this increase in numbers has been an even more significant increase in expectations. . . .\(^n\)\\text{[16]}\\\n
Meeting the needs of the public comes to be configured as a potentially unreasonable public expectation rather than as the appropriate fulfillment of a public trust: \n
There are pressures for success on the medical community that have never before existed—pressures, moreover, that the community itself would dearly like to satisfy, however unreasonable they may appear. . . . In the end, this is focused on the school of medicine. It must provide, somehow, generalists with a wide range of knowledge and skills; specialists with a profundity of insight and the capacity to manage increasingly intricate facilities; research men who can move medicine steady forward toward new goals; medical men akin in function and in spirit to systems engineers—all of these in numbers greater than ever before: and it must do all this in the face of insatiable public demand for accomplishment.\(^n\)\\text{[17]}\\\n
The 1965 Association of American Medical Colleges (AAMC) report notes, "Not only have expectations risen but, more importantly, an attitude of 'entitlement' is becoming increasingly prevalent.\(^n\)\\text{[18]}\\\n
And the 1982 AMA report states, "The public has . . . expected more immediate results from the money provided for research. Expectations have not been realistic. . . .\(^n\)\\text{[19]}\\\n
The quasi-adversarial relationship suggested in these reports, by discussion of "demands," expectations," entitlements, and "rights" that are "unrealistic" or "insatiable" is altogether different from the way such things were discussed in earlier reports. Before the 1960s, reports conceptualize public expectations as "desires," "wishes," or simply "needs." \n
The Objectives of Reform \n
Eight basic objectives of reform emerge in the proposals to reform medical education (Table 2), and these may be grouped in two categories: core objectives and secondary objectives. The core objectives reflect the social obligation of medical schools discussed herein,
occur frequently within each report and across reports, and address fundamental
purposes underlying medical education. The secondary objectives are less
tightly linked to the social nature of medicine, occur less frequently, and are
less fundamental.

In order of their overall centrality to reform proposals (in terms of the quanti
ty and quality of the attention they are accorded within and across the reports),
the four core objectives are: (1) to better serve the public interest, (2) to address
physician workforce needs, (3) to cope with burgeoning medical knowledge, and
(4) to increase the generalist character of medical education.

The first core objective, to better meet the needs of the community, is not re
stricted to the number and type of physicians produced by medical schools; it
also refers to the types of diseases investigated by medical schools and to the way
those schools deliver health care. For instance, the 1982 AAMC report empha
sizes the fact that reforms are needed to bring medical education into "a more sat
sactory relationship with the "needs of society." 11(2) In the most explicit exposi
tion of this objective, linking the proposed reform of medical education to the na
ture of the medical profession, the 1993 Pew report observes,

The health professions are respected because of the special, almost sacred, role they
have in matters of life and death. This most human of all enterprises—welcoming new
life, aiding the sick, and comforting the dying—should be one that is always held in
the highest esteem by those who benefit from these services. The only legitimate
source for such a position in society is when it is drawn from the health care needs of the
public. If the professions are to be reserved from becoming just associations for health
care workers, then their work must begin and end on the fundamental values that de
fine and shape their calling.11(2)

The second core objective of reform is to address the workforce needs of soci
ety, in terms of numbers of physicians and their distribution. This objective,
like the foregoing one, grows out of the social covenant of medical schools. For
example, the need to increase the number of physicians was a powerful objec
tive of medical education reform from the mid 1960s to the late 1970s, and the
1965 AAMC report noted,

Few persons...believe [the medical education]
approach...is adequate for the needs of the
medical profession.11(2)11(3)

There is an almost deliberate conflation of the "improvement" of medical educa
tion on the one hand and increasing the number of physicians on the other.

The third core objective is to cope with the burgeoning knowledge base of medi
cine. For example, the 1985 AAMC report begins with the observation, "Dur
ing the past half century, advances in medicine have been more significant and
rapid than in any previous periods of human history."11(2) It elaborates further,

The phenomenal growth of knowledge during this period has increased at an ever-accelerat
ing pace. Although still attempted, it is becoming more apparent to the educator that
it is no longer possible to provide encyclopedic coverage of the concepts and skills of medicine
within the limited time available.11(2)

The 1982 Robert Wood Johnson Foun
dation report similarly observes, "Bio
medical research has created an explo
sion in the volume, complexity, and rate
of change of medical information. When
the sum of it all seems to strain human
cognitive capacities, the effective man
agement of information becomes criti
cal."11(2) Reform is needed, the reports
argue, to enhance the way the educa
tional system handles this constant "ex
plosion" of knowledge.

The fourth core objective of reform, to maintain a "broad" and "generalist" charac
ter to medical education, finds two expressions: to reform education so that it
is less "fragmented" and to reform education so as to increase student inter
est in generalist careers. In the con
text of discussing the goals of reform, the 1966 AMA report notes, "Speciali
zation, with all of its advantages, has led to a fragmentation, an insufficiency
of physicians who are competent and willing to offer comprehensive and
continuing care."11(2) The 1989 New
York Academy of Sciences report notes,
"Clinical education has drifted away from
being a broad preparation of the undif
ferentiated doctor and is becoming an
increasingly fragmented, technically
oriented training program for specialists."11(2) With respect to the objective of
increasing the emphasis on general
ism, the reports are virtually unanimous. Arguing that specialization was corrup
ting undergraduate medical education, the 1982 AAMC report observes,

There has been a tendency in recent years to attempt to provide instruction in the medical
course in the various special fields of prac
tice. This has been responsible in part for the
great overburdening of the curriculum and
the confusion regarding the purposes of the
basic training. Changes in the methods and forms of practice should not be the guide for
determining the educational needs of the medical students.11(2)

The 1982 AMA report summarizes this objective of reform as follows:

The major theme of this report is the balance
between generalism and specialization required
to permit individuals to develop into well
 educated physicians who possess a broad
perspective of society,... The basic premise
underlying many of the recommendations in

* The objectives are listed roughly in order of their overall centrality to reform proposals, in terms of the quantity and quality of the attention they are accorded within and across the reports. For example, though "increasing the quality and standards of education" is moderately common, it is often the subject of brief treatment within the reports, and it is rarely acknowledged explicitly as an important objective. See Table 1 for titles of reports corresponding to years indicated.

---
this report is that physicians should be broadly educated if medicine is to continue to be a highly respected profession.\(^{99,100}\)

Fostering generality is implicitly linked with the special relationship between the medical profession and society.

The two secondary objectives of medical education reform, in order of centrality, are (1) to apply new methods of teaching, (2) to address the changing illness burden confronted by society, (3) to address the changing nature of practice arrangements, and (4) to increase the quality of education.

Part of the impetus to reform has been the desire to apply ostensibly new pedagogic methods. For example, the first sentence of the 1932 AAMC report states as its purpose "to make suggestions which would bring [medical education] into more satisfactory relationships with the newer conceptions and methods of university education." The 1966 ASA report similarly notes that "the change in the understanding of educational process is one of the bases of the need for change."\(^{101,102}\)

Efforts to reform medical education have also had the twin objectives of bringing medical education into alignment with the changing nature of medical practice and the changing illness burden in society. For example, the 1984 AAMC report notes that "medical faculties should adapt the general professional education of students to changing demographics and the modifications occurring in the health care system," that "chronic disease is growing dramatically," that "acute care hospital utilization is decreasing," and that "new organizational forms for delivering health care have appeared."\(^{103,104}\)

Increasing the quality of medical education, while a fairly common objective of reform, is rarely explicitly treated as important or central in the reports. When this objective does appear, especially in the early reports, it is usually out of concern that too many practitioners of "indefinite" quality were being let loose on an "innocent public."

The Proposed Reforms

The reports have been extraordinarily consistent in the specific reforms proposed to achieve the eight objectives delineated herein and to correct the perceived deficiencies in medical education—to the point that the wording of some of the recommendations is identical. Reforms may be grouped in four categories: manner of teaching, content of teaching, faculty development, and organizational factors. As shown in Table 3, few reforms emerge as truly novel. Many currently popular reforms have been advocated since the earliest reports and have appeared almost continuously since then.

In some cases, there is a relatively straightforward link between the objective of reform and the specific reform proposed in the report. For example, the burgeoning of medical knowledge drives changes in the content of education and also drives the necessity to teach students habits of "lifelong learning." Addressing societal workforce needs is directly linked to a number of specific reforms, such as increasing class size, decreasing the length of training, and moving curricular elements from medical school back to undergraduate schools. And the changing nature of disease patterns and practice arrangements is often used to motivate proposals to increase the social sciences. In other cases, however, the link between the objectives and the reforms is less explicit; for example, the proposal to reform evaluation methods is only implicitly linked with the objective of increasing the quality of medical school education.

Teaching students to be lifelong learners has been the most consistent reform proposed by the reports, appearing in virtually all of them. While the term "lifelong learning" first appeared in the 1963 Josiah Macy Foundation report,\(^{105,106}\) the notion was present from the beginning of efforts to reform medical education; for example, the 1982 AAMC report notes, "[Medical school can only begin the education of the physician, for he must remain a student throughout life."

Similarly, the reports endorse "problem-solving methods of teaching that require students to seek out, rather than be given, information"\(^{107,108}\) and "educational experiences that require students to be active, independent learners and problem-solvers rather than passive recipients of information."\(^{109,110}\)

The most common proposals regarding the content taught at medical schools are to increase generalism and ambulatory care exposure, and many reports recommend outpatient over inpatient settings for education. The proposal to increase the amount of social science training in the curriculum is a prominent manifestation of the reports' articulated commitment to the notion of medicine as a social good, although what is considered to be a "social science" has varied considerably over the years.

Proposals to reward teaching have been around since the earliest reports as well. The 1932 AAMC report observes,

If clinical teaching is to attract and hold teachers of the caliber and ability which it requires, and provide a corps of younger instructors from which the senior members of the staff may be recruited, there must be a fuller recognition of the freedom and dignity which such work should command. ... It is vital that universities provide the inducements which will attract and hold clinicians of the caliber and ability which teaching in this field requires and which the responsibilities for the care of patients in the hospitals and clinics demand.\(^{111,112}\)

The 1970 Carnegie Commission report recommends that universities "place greater emphasis on the rewarding of scholarly activity for the faculty, especially in connection with salary and promotion policies."\(^{113,114}\) Similar invitations appear in virtually every subsequent report.

CONCLUSION

Proposals to reform medical education have three rhetorical parts: they articulate (1) a purpose of medicine and medical schools, (2) objectives of reform, and (3) specific reforms. These three parts are systematically related: the reforms are in keeping with the objectives, which are in keeping with the perceived purpose. In addition to sharing this rhetorical structure, the reports have also articulated a remarkably similar purpose of medicine, identified remarkably similar objectives of reform, and proposed remarkably similar reforms. For nearly a century, in spite of dramatic changes in the context in which medicine is practiced (in terms of the illness burden in the United States, the diagnostic and therapeutic armamentarium, and the organization of medical care), the reports suggesting reform of US medical education have been strikingly similar in structure, content, and tone.

What accounts for this similarity? There are at least three possible explanations. One is that the problems with medical education are inherently irremediable. Another is that the commitment to achieve reform, and the commitment to do so, have been inadequate. But, as indicated herein, a more likely explanation is that important purposes in addition to reform may underlie and motivate the promulgation of these reports.

With respect to the first explanation, it does not seem credible that problems in medical education are insoluble or that medical education cannot be changed. Indeed, several reports acknowledge that significant change in medical education has occurred.\(^{115}\) Nevertheless, it is also true that there are certain structural problems inherent in medical education that are themselves invariant. For example, each report has had to contend with the problem that there has always been and will always be too much to know; medical knowledge is theoretically and practically limitless. Moreover, the solution to this problem is to sug-

*Not all reforms ever proposed in all reports are listed. Some of the proposed reforms included in the table were implicit and some explicit in the reports. See Table 1 for titles of reports corresponding to years indicated.

+tSocial science is variously configured by the reports to include economics, ethics, behavioral science, and history, in addition to sociology and the like.

gest ways that the knowledge might be assimilated during a longer period (thus, the concept of lifelong learning or the lengthening of postgraduate medical training) or more efficiently (thus, problem-based learning and other pedagogic innovations). A further, relatively constant structural problem is that of how many and what type of physicians to produce. Optimizing the fit between workforce production and societal needs is a never-ending task, since societal needs necessarily change. Each report has thus had to deal with this problem and has tended to propose relatively straightforward corrective modifications in medical education.

The second explanation also seems unlikely to fully account for the similarity of the reports. Medical educators express substantial support for the specific reforms reviewed herein; indeed, the educators are typically the proponents of reform. For example, the great majority of educators in one recent survey strongly supported reforms such as "develop a system for evaluating and rewarding faculty for teaching excellence," "increase the integration between basic sciences and the clinical phases of medical student education," "develop testing mechanisms to evaluate students' independent problem-solving skills," and "move more clinical education from infrequent to ambulatory and community settings." This brings us to the third explanation. Sociologist Samuel Bloom has argued that the history of "reform without change" in medical education is accounted for by the fact that "medical education's manifest humanistic mission is little more than a screen for the research mission, which is the major concern of the institution's social structure." In my view,
